

Usage of nut:

The direction of flange face of nut should be paid attention to.

1. Wrong method: the direction of the flange face of the nut is on the same side of the board with the bolt head. At this time, the upward tension of the bolt pulls out the four-jaw nut, and the purpose of tightening cannot be achieved.
2. Correct method: when the flange face and bolt head of the nut are respectively on both sides of the board, the four-jaw nut installs the bolt and the four-jaw from the bottom of the board to form a tension force to achieve the purpose of tightening.
