Title

Li-ion Battery Specifications (Steel)

Revision History

Revision	Date	Originator	Description
B/0	2008-03-20	Engineering Cente	er Original Release
	No: 9-E167-NH	ICR18650NH	Engineering Center

Title	Li-ion Battery Specifications (Steel)	Page	1/11
-------	---------------------------------------	------	------

1. Scope

This Specification is applied to rechargeable lithium ion battery cell of the following mentioned type for various applications in mobile communication devices and portable power systems.

2. Cell Classification and Type

2.1 Cell Classification : Lithium Ion Battery Cell

2.2 Cell Type : ICR18650NH

3. Standard

The specification is based on the technical specification of GB/T18287-2000 、UL1642 and IEC61960.

4. Nominal Specification

	Item		Specification	Remarks
4.1	1 Typical capacity		2200mAh	0.2 C ₅ A discharge
4.2	.2 Minimum Capacity		2150mAh	
4.2 N	ominal Voltage		3.7V	
4.3 D	ischarging Voltage (Min)		2.75V	
4.4 C	harging Voltage (Max.)		$4.2 \pm 0.03 V$	
4.5 C	harging Current (Std.)		0.5 C ₅ A	
4.6 D	ischarging Current (Std.)		0.2 C ₅ A	
4.7 Charging Current (Fast)		1 C₅A	0 ~ 40°C, <u><</u> 95%RH	
4.8 D	ischarging Current (Fast)		1 C₅A	
4.9 D	ischarging Current (Max.)		2 C ₅ A	
4.10	Internal Impedance		70mΩ	AC impedance 1kHz Difference among cells should be less than 10m in a shipment.
4.11 \	Weight		45.0 ± 2.0g	
4.12 Outline dimension (see figure)		Diameter	18.2±0.2mm (Including PVC)	
		Length	64.8±0.5mm	
4.13	Battery cell storage and	Min 1 Month	-20 ~ +60°C, <75%RH*	Initial status of cell 3.80V and
transportation environment and		Min 3 Months	-20 ~ +45°C, <75%RH*	50% of charge, the capacity los during shipment < 20%.
temp	erature ranges	Min 12 Months	-20 ~ +25°C, <75%RH*	Capacity recover rate > 80%.

Title

Li-ion Battery Specifications (Steel)

2/11

5. Electrical Characteristics

Item	Test Method	Performances
5.1 Full Charge	The charger supplies 1C constant current until battery voltage reaches 4.2V , then be changed at constant voltage of 4.2V while tapering the charge current to less than or equal to 0.01 C. Charging time is 3.0 hours in all.	
5.2 Capacity	Within 1 hour after fully charged, discharged at 0.2C continuously down to 2.75V.	More than 300min
	Within 1 hour after fully charged, discharge at 1C continuously down to 2.75V.	More than 54min
5.3 Cycle life	A battery unit shall be repeated 300 charge/discharge cycles, charged at CC-CV (0.5 C - 4.2V) for 3. 0 hours, discharged at 0.5C continuously down to 2.75V Cut-off Voltage. Measure discharge capacity.	≥ 80% capacity
	HYB guarantee that the residual capacity of 2 cells in series without circuitry is over than 80% after 300 cycles.	
	(Capacity testing after 300 cycles will be performed under condition of 0.5C charging and 0.2C discharging)	
5.4 Capacity retention	After fully charged, stored for 28 days at 20°C, then for 1 hour between 20°C to 25°C and continuously discharge at 1C to 2.75V.	Capacity retention rate ≥ 85%

Minimun Capacity

The minimum capacity is in the specifications table. The term refers to the capacity when the charged cells are discharged to the cut-off voltage for 5 hours at $20^{\circ}C\pm5^{\circ}C$.

Typical Capacity

Typical capacity refers to the median value of the capacity when a battery cell is discharged to the cut-off voltage with the current of 0.2 C at 20° C ± 5° C.

Limit Charge Voltage

Charged cells with constant current to reach a voltage value, then keep the voltage constant and continue to charge them. The voltage is referred to as limited charge voltage. The value is 4.2V.

Cut-off Voltage

Cut-off Voltage Refers to the end voltage when a battery cell is discharged to reach. The value is 2.75V.

Precautions

Precautions on Battery Pack Design

- Fix cells with mold case by rib, tape, glue etc., but don't make damage cells (especially in sealing part) by rib or sharp part of mold case. In case the battery pack is struck by hard shock or vibration, the battery pack has possibility to cause leakage, smoke, or explosion.
- It is recommended that the protection device such as PTC (e.g. VTP210.VTP170) or thermal fuse (e.g. TA1, TA2) should be used to protect the battery from the abnormality of equipment.

13. Storage Condition

Recommended Storage Temperature and Humidity

• Store the battery cell at temperature range -5 ~+35 , relative humidity of less than 75% and no corrosive gas atmosphere. Keep far away from fire or heat.

Long Period Storage

- In case of long period storage (more than 3 months), store the battery cell at temperature range -5~+25°C, less than 75% humidity, no corrosive gas atmosphere. And in this case, charge/discharge condition of one full cycle, and store the battery at 3.8V/cell.
- When storing the cell over one year, charge the cell at least once a year.
- No condensation on the cell.

14. Exemption from Warrantee

- HYB will not be responsible for trouble occurred by handling outside of the precautions in this specification.
- HYB will not be responsible for trouble occurred by matching electric circuit, battery pack, terminal and charger. In case of any problem, an analysis must be conducted to determine the cause of failure.
- HYB will not be responsible for any fault resulted from battery pack assembly such as welding *etc.* after acceptance of cells.

15. Safety Instruction

Prohibition Points and Handle

The battery cell includes the flammable objects such as the organic solvent. If the handling is missed there will be possibility that the battery cell ruptures, flames or hot, or it will cause the deterioration or damage of battery cell. Please observe the following prohibitive matters. And also, add the protection device the equipment for fear that the trouble would affect the battery cell by the abnormality of equipment. In addition, mention the following matters as "Prohibition Points on Handle" in the instruction manual of the equipment.

16. Warranty Period of Battery

The warranty period of a battery cell is for 12 months after shipment. However, even within the warranty period, HYB will only be responsible for defect of cells related to manufacturing process. Any other problem caused by malfunction of the equipment or unsuitable use of the cell will not be covered under this warranty.

 Danger I 1. Disassemble and Reconstruction "Do not disassemble or reconstruct battery" The battery pack has safety function and protection circuit to avoid the danger. If they have serous damage, it will of the generating heat, smoke, rupture or flame. 2. Short-circuit "Do not short-circuit battery cell Do not connect + and – terminals with metals (such as wire). Do not carry or store the battery cell with metal objects o as wire, or hairpins). If the battery cell is short-circuited excessive large current will flow and then the generating smoke, rupture or flame will occur. And also, it causes generating heat at metals. Incineration and Heating "Do not incinerate or heat the battery cell" These occur the melting of insulator, damage of gas release vent or safety function, or ignition on electrolyte. A mentioned matters cause the generating heat, smoke, rupture or flame. Use nearby Heated Place "Do not use or leave battery nearby fire, stove or heated place (more than 80°C)" In cases that separator made of polymer is melted by high temperature, the internal short-circuit occurs in individual and then it causes the generating heat, smoke, rupture or flame. In addition, do not use the battery cell under the h place (more than 80°C). Immersion "Do not incinerate or neated place or sea water, or get it wet" If the protection circuit included in the battery cell is broken, the battery cell will be charged at extreme current or v and the abnormal chemical reaction occurs in it. And then it causes the generating heat, smoke, rupture or flame. Charge nearby Heated Place "Do Not charge battery nearby the fire or under the blazing sun" If the protection circuit to avoid the danger works under high temperature or it is broken, the battery cell will be charge abnormal current (or voltage) and abnormal chemical reaction will occur. It causes the generating heat, smoke, rupture flame. Charge and C	Title	Li-ion Battery Specifications (Steel)	Page	8/11

Warning !

1. Mixed Use

"Do not use lithium ion battery cell in mixture"

Do not use lithium ion battery cell with the primary batteries or secondary batteries whose capacity or kinds or maker is different. If do that, the battery cell will be discharged or charged excessively in use. And it may cause the generating heat, smoke, rupture or flame because of the abnormal chemical reaction in cells.

2. Ingestion

"Keep the battery cell away from babies"

Keep the little battery cell out of the reach of babies in order to avoid troubles by Swallowing. In case of swallowing the battery, see a doctor immediately.

3. Charging Time

"Do not continue to charge battery cell over specified time"

If the battery cell is not finished charging over regulated time, let it stop charging. There is possibility that the battery cell might generate heat, smoke, rupture or flame.

4. Storage

"Do not get into a microwave or a high pressure container"

It causes the generating heat, smoke, rupture or flame because of a sudden heat or damage of sealing condition of battery cell.

5. Leakage

"Do not use a leaked battery cell narby fire"

If the liquid leaks from the battery cell (or the battery gives out bad smell), let the battery cell leave from flammable objects immediately. Unless do that, the electrolyte leaked from battery cell will catch fire and it will cause the smoke, flame or rupture of it.

6. Rust, Charging color and Deformation

"Do not use an abnormal battery cell"

In case the battery cell has bad smell or is generated its changing color or deformation or causes something wrong in using (includes charging and storage). Let it take out from equipment or charger and do not use it. If an abnormal battery cell is used, it will generate heat, smoke, rupture or flame.

Title	Li-ion Battery Specifications (Steel)	Page	11/11

Caution !

1. Use under strong sunshine

Do not use or leave the battery cell under the blazing sun (or in heated car by sunshine). The battery cell may generate heat, smoke or flame. And also, it might cause the deterioration of battery cell's characteristics or cycle life.

2. Static Electricity

The battery pack has the protection circuit to avoid the danger. Do not use nearby the place where generates static electricity (more than 100V) which gives damage to the protection circuit. If the protection circuit were broken, the battery cell would hide danger.

3. Charging Temperature Range

Charging temperature range is regulated between 0°C and 40°C. Do not charge the battery cell out of recommended temperature range. Charging out of recommended range might cause the generating heat or serous damage of battery cell. And also, if might cause the deterioration of battery cell's characteristics and cycle life.

4. Manual

Please read the manual before using the battery cell and keep it after reading.

5. Charging method

Please read the manual of specified charger about charging method.

6. First time use

When the battery cell has rust, bad smell or something abnormal at first-time using, do not use the equipment and go to bring the battery cell to the shop which it was bought.

7. Leakage

If the skin or cloth is smeared with liquid form the battery cell, wash with fresh water. It may cause the skin inflammation.
